

Product code: SP27

Description: Extraction plate and counter bushing for extractor press  
SP21 / SP20

New product / replacement: New

- The steel extraction plate fits in the main body of SP21 to extract the pinions. It is designed to allow extraction even if the pinions are located very close to the motor case without causing any damage to it.
- The counter bushing has two very important functions:
  - To centre the double shaft motor perfectly by means of the axle housing hole.
  - To keep all those motors that are not equipped with the double shaft centred and, at the same time, safeguard the inner bushing of those 'long can' motors that do not have an axle stub protruding from the can.
